SUMMARY

Web3 product manager and full-stack engineer with 6+ years of experience delivering BSC/EVM wallets, stablecoin payment flows, smart contract products, and token infrastructure. Own product discovery, roadmaps, PRDs, architecture, development, launch, and iteration in high-autonomy environments. Defined five wallet and token-platform models spanning server-managed, WalletConnect-based, hybrid on/off-chain, smart-contract payment, and centralized-ledger systems. Fluent in English, with extensive U.S. academic and professional experience and direct ownership of global exchange listing communications.

CORE COMPETENCIES

- Product Strategy & Roadmaps
- PRDs · User Flows · Acceptance Criteria
- BSC / EVM Wallet Architecture
- Stablecoin Payments & Settlement
- Smart Contracts & Tokenomics
- On-Chain Data (BscScan / Etherscan)
- AI-Native Product Development
- Global Exchange Listings

EXPERIENCE

Blockchain Product Lead UNIDECA (Web3 Consulting)

May 2025 – Present

Seoul, South Korea · Primary product & technical owner

- Own product discovery, roadmaps, requirements, architecture, development, launch, and operations for **five BSC wallet and token platforms**, translating non-technical foundation requests into structured PRDs, functional specifications, user flows, and prioritized implementation plans.
- Defined wallet models spanning server-managed wallets, WalletConnect-based external wallets, hybrid on/off-chain ledgers, smart-contract payments, and centralized token economies, selecting custody and settlement boundaries based on security, gas cost, operational control, and user needs.
- Launched a production hybrid BSC token platform that reached **783 registered users, 398 purchasers (51% conversion), and 844K USDT in cumulative token purchase volume** within five months.
- Designed tokenomics and authored whitepapers for **10+ projects**, covering supply, allocation, utility, vesting, lockups, staking rewards, circulating supply, liquidity, burn mechanics, and treasury structure.
- Led end-to-end listing execution for **9+ token projects** across KuCoin, MEXC, Gate, LBank, Coinstore, and BitMart, managing applications, due diligence, technical integration, market makers, liquidity, circulation disclosures, launch schedules, and direct English communication.
- Represented the company at Consensus Hong Kong 2026 and led cross-functional delivery across foundations, engineering, design, marketing, and international ecosystem partners.

- Led product and technical delivery for **Emetal Exchange**, a government-backed blockchain marketplace digitizing offline non-ferrous-metal trading through auction and reverse-auction workflows, verifiable transaction records, and escrow settlement.
- Defined the domain model and delivered Solidity contracts covering listing, bidding, settlement conditions, winner payment, and unsuccessful-bid refunds; integrated MetaMask, Web3j, Infura, and Etherscan transaction tracking.
- Coordinated independent third-party validation that achieved **100% smart contract execution accuracy** and supported 200 concurrent users with a 0% error rate; designed the product flow for future Nonghyup virtual-account escrow integration.
- Contributed to the patented "Integrated Aluminum Ingot Trading Management System" (registered Jan 2022), and supported BlockApps' Korea market entry through direct coordination with its U.S. team.

Java Backend Developer **Delta Dental of Michigan**

Feb 2020 – Jan 2021

- Backend API development (Java / Spring Boot) for a dental insurance intranet system, Lansing, MI, within a distributed agile team.

Software Engineering Intern **Apolis**

Aug 2019 – Jan 2020

- Backend API development (Java / Spring Boot microservices) for a hotel reservation management system.

KEY PROJECTS**Education Foundation Token Platform — Hybrid BSC Wallet**

Oct 2025 – Present · Launched Apr 2026

BSC · WalletConnect · React · NestJS · PostgreSQL · Redis · BscScan · Passkey · Google OTP

- Converted a foundation's high-level request for deposits, withdrawals, staking, promotions, and lockups into a production-grade platform, independently owning discovery, PRDs, architecture, development, launch, and ongoing operations.
- Designed a hybrid architecture using WalletConnect-based USDT deposits, automated on-chain verification, an off-chain ledger for purchases, staking, lockups, and internal transfers, and real-token settlement at withdrawal—reducing gas exposure and operational complexity.
- Built OTP/Passkey security, Telegram event alerts, treasury reconciliation, gas-reserve monitoring, simulations, audit logs, and an operations dashboard; reached **783 users, 398 purchasers, and 844K USDT in purchase volume** within five months.

BSC Node Purchase Platform — Smart-Contract Payments

2026

BSC · Solidity · Hardhat · ethers.js · BEP-20 USDT · BscScan · NestJS · PostgreSQL

- Designed a custodial BSC wallet with smart-contract-based USDT purchases: users approve BEP-20 spending, execute contract purchases, and receive off-chain token allocations and lockups from verified events.
- Implemented contract pause, price, treasury, and ownership controls; added pre-transaction static-call validation, receipt verification, BscScan transaction synchronization, and event-driven backend processing.

RankFit — AI-Powered SEO / AEO / GEO Intelligence SaaS

May 2026 – Present

Next.js · NestJS · Prisma · PostgreSQL · Redis · BullMQ · Playwright · PageSpeed · OpenAI · Claude

- Independently designed and built an AI-native search-intelligence SaaS validated across **19 company and personal web projects**, combining multi-page crawling, deterministic scoring, competitor benchmarking, and AI-search visibility testing.
- Applied RankFit to a live client website and guided improvements that raised its score from **77 to 89** under the same model, including Technical SEO 87→100, On-page 82→100, AEO 24→74, and GEO 58→85.
- Architected asynchronous crawling and LLM workloads with BullMQ; used Claude for structured diagnosis and OpenAI/Claude web-search APIs for engine-specific visibility tests, with schema validation, prompt-injection safeguards, redaction, retries, and graceful fallbacks.

UNIDECA Reference Wallet — Server-Managed EVM Wallet

2025 – Present

BSC · ethers.js · React · NestJS · PostgreSQL · BscScan · WebAuthn · Google OTP

- Built a functioning BSC wallet that generates real EVM addresses and user-exportable mnemonic credentials, supports BNB/USDT on-chain transfers, and manages project-token purchases, staking, lockups, referrals, and internal balances.
- Implemented encrypted key storage, OTP, Passkey/WebAuthn, BscScan transaction history, multilingual UI, and full administrative controls; used as a live reference in client product discovery and sales.

Tokenized Wallet & Commerce Platform

2026

BSC · React · NestJS · PostgreSQL · ethers.js · BscScan · USDT · OTP

- Designed a server-managed BSC wallet platform combining on-chain USDT settlement with off-chain project-token balances, dynamic token pricing, internal transfers, rewards, and commerce workflows.
- Delivered token purchase, redemption, and swap flows, marketplace orders, digital vouchers, settlement and transaction records, price history, BscScan synchronization, and administrator audit controls.

EDUCATION

University of Minnesota, Twin Cities

Sep 2017 – May 2019

B.A., Computer Science (major) · Mathematics (minor) — GPA 3.0/4.0 · Transfer student

LANGUAGES

Korean (native) · English (fluent) · Extensive U.S. academic and professional experience · Direct ownership of global exchange listing communications and international client engagement, including Consensus Hong Kong 2026
